Abstract

A computerized method, a computer-readable medium, and a system each pertain to the creation of an electronic literary work on a computer system. According to a representative methodology, a first working area of an application program is populated with selected digital images from an archive image set, to generate a contact sheet view comprising an imported image set. A second working area is populated with selected images from the imported image set to establish a working image set which is arrange into a selected storyboard sequence. Respective image data is associated with at least some of the digital images within the working set to define pairs of companion image items which are then displayed according to the storyboard sequence. An electronic literary work produced according to such a methodology is also provided.
